## Abstracts

According to our latest research, the global Age Hardening market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Age hardening is a widely used and effective heat treatment process. During the aging process, supersaturated solid solutions undergo reactions such as precipitation, segregation, and ordering, thereby increasing the resistance to dislocation movement. Used to increase the strength, hardness and properties of certain alloys. During the age hardening process, controlling aging temperature, time and other conditions can allow the alloy to obtain different microstructures and strengthening effects. Age hardening occupies an important position in the metal heat treatment process, and its purpose is to improve the performance of the material through the adaptive transformation of the microstructure. This process is not limited to metals, plastics, rubber, chips and other materials can also undergo similar aging treatment.
