Abstracts

According to our (Global Info Research) latest study, the global AI Chips market size was valued at US\$ 92606 million in 2025 and is forecast to a readjusted size of US\$ 325907 million by 2032 with a CAGR of 19.5% during review period.

In 2025, global AI Chips capacity 8,000 k Pcs, sales reached approximately 7,500 k Pcs, with an average market price of around 12,000 USD/Pcs, industrial gross margin 54%.

AI chips have shifted from “a single accelerator” to a system product: in the cloud, GPUs or in-house ASICs are packaged with high-speed interconnects, rack-scale power delivery and liquid cooling to industrialize training and inference as repeatable “AI factories”; on-device, AI chips are embedded into SoCs/CPUs where privacy, power and user experience define differentiation. The market’s center of gravity spans three tracks: NVIDIA-style GPU + full-stack systems, AMD/Intel pushing datacenter accelerators and open software, and hyperscalers (Google/AWS/Microsoft/Meta) scaling in-house ASICs to secure supply and economics; at the edge, Apple and Qualcomm turn NPUs into platform gates.

AI-chip KPIs are moving from peak compute to system efficiency across compute ? memory ? interconnect ? power density. HBM capacity/bandwidth is now decisive (e.g., MI300X discloses 192GB HBM3 and 5.3TB/s; Gaudi 3 up to 128GB HBM and 3.7TB/s; TPU v5p publishes per-chip HBM specs). Low precision (FP8/FP4) and new kernels are the incremental lever for inference and reasoning workloads, while rack-scale fabrics improve realized throughput (NVL72 emphasizes a unified 72-GPU domain and 130TB/s-class fabric; Blackwell Ultra discloses NVLink 5 bandwidth and max topology). Power density and cooling are “chip-level constraints,” with DGX-class systems

publishing system power and HBM3e bandwidth; in automotive/robotics, determinism and safety isolation become part of what an AI chip is, exemplified by disclosed Thor compute and power envelopes.

Across the supply chain, AI chips are increasingly a systems game: upstream, leading-edge nodes plus advanced packaging (2.5D/CoWoS-class) and HBM supply set the ramp speed; midstream, competition extends from silicon into boards, servers, racks, networking and the software stack (compilers/inference runtimes/collectives) that determines time-to-deploy and stickiness; downstream, hyperscalers, internet platforms, automakers and device OEMs harden requirements into specs. A telling recent move is how rack-scale delivery becomes part of “AI chip capability”: AMD has completed its acquisition of ZT Systems, explicitly combining CPU+GPU+networking with rack-scale systems expertise to match how hyperscalers buy and deploy.

Growth is spilling out along three lines. (1) Datacenter AI chips are shifting from “single-GPU racing” to “AI-factory racing,” with hyperscalers publishing rack/cluster-scale availability (OCI discloses liquid-cooled GB200 NVL72 for very large clusters; SK Group and NVIDIA announce an AI factory exceeding 50,000 GPUs, anchored by manufacturing, digital twins and agents). (2) Geopolitics and compliance have become part of product roadmaps: the U.S. AI diffusion framework and its subsequent rescission—along with continuing guidance on advanced computing ICs—push finer-grained supply, SKU and shipment strategies. (3) On-device AI chips are becoming eligibility gates: Windows writes a 40+ TOPS NPU threshold into Copilot+ PC requirements; Apple discloses M4’s 38 TOPS Neural Engine and ties on-device GenAI to system experience; in vehicles, centralized compute platforms like Thor point to cockpit + AD fusion and higher safety-grade compute as the next leg. Over the next 12–24 months, the most bankable trend is not just “bigger models,” but “more inference, stronger systems, deeper verticalization”: FP4/FP8 inference and communication efficiency become the power-efficiency battlefield; HBM and advanced packaging remain critical supply constraints; sovereign/industry AI factories will expand procurement from chips to racks, power, liquid cooling and ops software; robotics and industrial edge broaden AI-chip demand from vision into multimodal real-time control.
