## Abstracts

According to our (Global Info Research) latest study, the global AI Lung Image Analysis market size was valued at US\$ 803 million in 2025 and is forecast to a readjusted size of US\$ 1537 million by 2032 with a CAGR of 9.8% during review period.

AI lung image analysis refers to a comprehensive technology that utilizes artificial intelligence (especially deep learning, computer vision, and machine learning) to automatically process, quantify, detect, classify, and assist in the diagnosis of lung medical images. Demand stems from the urgent global need to improve the efficiency and accuracy of lung disease diagnosis and treatment, particularly addressing significant clinical gaps in early lung cancer screening, rapid diagnosis of emerging respiratory infectious diseases, and management of chronic respiratory diseases. Its development is strongly driven by population aging, uneven distribution of medical resources, and the trend towards precision medicine. The core of the upstream supply chain for AI lung image analysis technology is the supply and annotation of high-quality medical image data, which relies on large hospitals, medical image databases, and professional annotation service providers, as well as technology companies providing dedicated AI chips and cloud computing resources. Downstream, it directly serves medical institutions, health check centers, and clinical trial departments of pharmaceutical companies. In 2025, the average selling price of AI lung image analysis technology was approximately \$60,000, with a gross profit margin of approximately 45%.
