According to our (Global Info Research) latest study, the global AI-powered Coronary Artery Calcium (CAC) Analysis Software market size was valued at US\$ 2058 million in 2025 and is forecast to a readjusted size of US\$ 4461 million by 2032 with a CAGR of 11.7% during review period.

AI-powered coronary artery calcium analysis(CAC) software is a medical image-assisted analysis tool based on artificial intelligence technology. It automatically analyzes cardiac CT scan images to accurately identify, locate, and quantify calcified plaques on the coronary artery walls, and calculates the internationally recognized coronary artery calcium score. This software aims to automate or semi-automate the process of manually delineating calcified plaques and calculating scores, which was previously a time-consuming and manual process for radiologists. This improves diagnostic efficiency, standardizes assessment results, and assists in cardiovascular disease risk stratification. The demand stems directly from the 'precision prevention' clinical trend driven by the increasing global burden of cardiovascular disease. Its upstream supply chain relies on high-quality labeled cardiac CT image databases, AI algorithm frameworks, and computing power development support, and requires deep technical integration with CT equipment manufacturers' image protocols and post-processing workstations. Downstream deployment occurs through medical institutions (health check centers, cardiology departments, radiology departments) and medical information systems, ultimately serving as a key tool for early screening and risk stratification of cardiac health, supporting personalized health management and public health prevention systems. In 2025, the average selling price of AI-powered coronary artery calcium analysis software was approximately \$40,000 per unit, with a gross profit margin of approximately 55%.
