The air-driven handpiece, also known as a pneumatic dental handpiece, is a commonly used high-speed handheld device in dental surgery and treatment. It utilizes the principle of pneumatics, driving the drill with a high-speed rotating turbine for dental repair and treatment. The features of this device include high-speed rotation, precise control, low noise, and lightweight design. It consists of a hand-held part, a pneumatic part, and a drill bit, which can be selected and replaced according to different treatment needs.

Air-driven handpieces are precision medical instruments used in dental treatments, primarily for tooth cleaning and restoration. With their high-speed rotating turbines, they effectively remove dirt and restorative materials from the surface of teeth. In recent years, as oral health awareness has increased and technology has advanced, the performance and comfort of pneumatic turbine handpieces have been significantly improved, reducing noise and vibration during treatment and enhancing cleaning efficiency and patient experience through design improvements. Currently, the development of pneumatic turbine handpieces is moving towards intelligence and personalization. It is expected that they will integrate smart sensor technology and data

feedback systems to achieve precise operation and personalized treatment plans, thereby improving therapeutic outcomes.
