## Abstracts

According to our latest research, the global Air and Missile Defense System (AMDS) market size will reach USD 41910 million in 2031, growing at a CAGR of 6.4% over the analysis period.

An Air and Missile Defense System (AMDS) is a comprehensive and integrated network designed to detect, track, intercept, and neutralize aerial threats such as aircraft, drones, cruise missiles, and ballistic missiles. These systems are crucial for national security, providing a defensive shield against potential attacks from the air and maintaining the integrity of a nation's airspace.

In recent years, anti-missile interception technology has been regarded as a core area of strategic defence by many countries in the world, but only a few countries have mastered this technology at present. The difficulty of its development has been compared to: "It's like hitting a bullet with a bullet hundreds of kilometres away." At present, the United States, Russia and China, France are the main countries that have mastered this technology, but the development status is different between them, owing to the arms race between the United States and the former USSR during the Cold War period, which led to the earliest development time in the world for the United States and Russia. For example, the Soviet Union first developed the S-75 Dvina, and the US has invested more than \$400 billion in various missile defence projects since the 1950s, when it first launched a programme of systems designed to intercept incoming nuclear or conventional weapons. Other governments have since invested in strengthening their own military capabilities by encouraging their own companies to join the research and development effort. Owing to geopolitical tensions in recent years, Integrated Air and Missile Defence has become the basis for guaranteeing national security, and some

countries with research and development capabilities have continued to invest significant amounts of military expenditure to have more complete systems, while others lacking research and development capabilities have been scrambling to acquire them. As technology has yet to break through, there are still no reliable and effective anti-missile systems to counter intercontinental ballistic missiles (ICBMs), for example. The Patriot and SAD missile defence systems, which are designed to counter short-range missiles, have had greater success in testing, but their utility is limited to a relatively small area of coverage. From a development standpoint, there will continue to be enormous amounts of public money invested in this category in the future, thus Integrated Air and Missile Defence has a positive market ahead of it.
