Abstracts

According to our (Global Info Research) latest study, the global Amine Antioxidants market size was valued at US\$ 690 million in 2025 and is forecast to a readjusted size of US\$ 916 million by 2032 with a CAGR of 4.1% during review period.

In 2025, the global production of amine antioxidants is estimated to be approximately 189,000 tons, with an average selling price of around US\$3,550 per ton. The average single-line production capacity is approximately 7,500 tons per year, with an average gross profit margin of 15-25%. Amine antioxidants are organic compounds that exert antioxidant effects by capturing peroxy radicals and terminating oxidation chain reactions, primarily through the amine group (-NH-) as the main active group. Their chemical structures are mostly aromatic secondary amine derivatives, such as diphenylamine and p-phenylenediamine. They exhibit excellent heat and ozone aging resistance in dark-colored materials such as rubber and polyurethane, but they are prone to causing discoloration of the products.

The upstream core raw materials for amine antioxidants mainly originate from petrochemical and coal chemical industries, including aniline, nitrobenzene, acetone, phenol, and diphenylamine. Their downstream applications are highly concentrated in industries requiring materials with excellent durability. The most important field is the tire and rubber industry (consuming the vast majority of production, used as an anti-aging agent in tires, hoses, seals, etc.), followed by the lubricating oil industry (used in the formulation of high-performance engine oils and industrial lubricants). They also have specific applications in some engineering plastics, synthetic fibers, and adhesives.
