According to our (Global Info Research) latest study, the global Analog Draw-wire Encoder market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

An analog draw-wire encoder is a type of position sensor that measures linear displacement or distance using a wire or cable. It consists of a wire or cable that is wound around a spool or drum, and as the wire is pulled or extended, the spool rotates. The rotation of the spool is then converted into an analog electrical signal, typically a voltage or current, which represents the position or displacement of the wire.

The analog draw-wire encoder is commonly used in various applications where linear position feedback is required, such as in industrial automation, robotics, and machine tools. It offers a simple and cost-effective solution for measuring linear displacement over a relatively long range.

The accuracy and resolution of an analog draw-wire encoder depend on factors such as the length of the wire, the diameter of the spool, and the quality of the sensing mechanism. The output signal can be calibrated and scaled to provide precise position measurements within a specified range.
