Abstracts

According to our (Global Info Research) latest study, the global Anhydrous Taphole Clay market size was valued at US\$ 709 million in 2024 and is forecast to a readjusted size of USD 936 million by 2031 with a CAGR of 4.0% during review period.

Taphole clay is a functional refractory material used to seal and protect the iron outlet, and its quality directly determines whether the blast furnace can operate safely and stably. At present, it can be divided into two categories: water taphole clay and anhydrous taphole clay. The former is used in small and medium-sized blast furnaces with low top pressure and low degree of enhanced smelting, while the latter is used in large and medium-sized blast furnaces with high top pressure and high degree of enhanced smelting. At present, waterless taphole clay is mainly used. Initially, tar was used as a binder for waterless taphole clay, but tar would produce smoke during use, deteriorate the working environment, and affect the physical and mental health of workers. Japan, the United States, Europe and other countries have developed waterless iron gun mud with resin as a binder. This type of gun mud not only eliminates the environmental pollution caused by tar as a binder, but also quickly hardens, reducing the unit consumption of gun mud (for example, the consumption of iron gun mud per ton of Chiba 4500 m³ blast furnace in Japan is only 0.25 kg/t), greatly improving the performance of waterless taphole clay.
