## Abstracts

According to our latest research, the global Anti-thrombogenic Coatings for Medical Devices market size will reach USD 1623 million in 2031, growing at a CAGR of 8.5% over the analysis period.

Anti-thrombogenic coatings for medical devices are specialized surface treatments applied to medical devices, such as catheters, stents, and heart valves, to prevent blood clot formation (thrombosis) upon contact with the device. These coatings are designed to mimic the natural properties of blood vessels, reducing the risk of clotting by inhibiting platelet adhesion and activation. Common materials used for anti-thrombogenic coatings include heparin, polyethylene glycol (PEG), and other bioactive compounds that interact with blood components to reduce clotting. By improving biocompatibility and reducing the need for anticoagulant therapies, these coatings enhance the safety and longevity of medical devices, particularly in long-term or high-risk applications.
