Abstracts

According to our latest research, the global Anti-thrombogenic Coatings market size will reach USD 2092 million in 2031, growing at a CAGR of 6.2% over the analysis period.

An Anti-thrombogenic Coating is a specialized surface treatment applied to medical devices, such as catheters, stents, and heart valves, to reduce the risk of blood clot formation (thrombosis). These coatings are designed to enhance biocompatibility by minimizing platelet adhesion and activation, which are key factors in clot development. They often incorporate materials like heparin, polymer hydrogels, or nitric oxide-releasing agents that mimic the natural properties of blood vessel linings. Anti-thrombogenic coatings are crucial in improving the safety and effectiveness of medical implants and devices used in cardiovascular and vascular treatments, significantly lowering the risk of complications such as blockages or device failure.
