An artificial bladder sphincter prosthesis is a medical device designed to provide control over urinary function in individuals who have lost the ability to control their bladder due to conditions such as spinal cord injuries, neurological disorders, or after certain surgeries. This prosthetic device consists of a cuff that is placed around the urethra, a pump implanted in the scrotum (for males) or labia (for females), and a pressure-regulating balloon placed in the abdomen. The device works by using the pump to inflate and deflate the cuff, thereby controlling urine flow. When the cuff is inflated, it constricts the urethra to prevent leakage, and when deflated, it allows urine to pass through the urethra. This technology has significantly improved the quality of life for many patients, offering a reliable solution for managing urinary incontinence.
