Abstracts

According to our (Global Info Research) latest study, the global Artificial Sweat market size was valued at US\$ 342 million in 2025 and is forecast to a readjusted size of US\$ 476 million by 2032 with a CAGR of 4.9% during review period.

Artificial sweat is a simulated solution formulated in a laboratory according to a specific standard formula based on the main chemical components and physicochemical properties (such as pH value, ion concentration, and organic composition) of real human sweat. It is a standardized chemical reagent used in scientific experiments, industrial testing, and product evaluation. Its main purpose is to simulate the corrosive, irritating, and migratory effects of sweat on various materials and products under controlled and repeatable conditions to assess their durability, safety, and biocompatibility. The demand for artificial sweat stems directly from global consumer product safety regulations' testing requirements for product biocompatibility and durability, as well as manufacturers' proactive quality control needs to ensure the safety, reliability, and compliance of their products (such as jewelry, textiles, and wearable devices) in real-world usage environments. Its upstream supply chain mainly includes suppliers of fine chemical raw materials (such as high-purity sodium chloride, lactic acid, urea, and pH buffers), manufacturers of laboratory equipment, and owners of intellectual property rights for standard formulations; downstream, it widely serves third-party testing and certification agencies, quality inspection departments of consumer product manufacturers (jewelry, apparel, and electronic products), and research institutions. In 2025, the production of artificial sweat is expected to reach approximately 9.5 million liters, with an average selling price of approximately US\$35 per liter, a gross profit margin of approximately 35%, and a single production line capacity of approximately 200,000 liters per year.
