Abstracts

Desulfurization and Denitrification is after floating ash in flue gas is roughly removed in the dry type electrostatic precipitator, the gas flows through the GGH extractor to be cooled to approximately 110 deg. C. In the spray cooler, the gas is further cooled to 60 - 70 deg. C, the desirable temperature level for desulfurization reaction, the necessary amount of ammonia for desulfurization and denitrification is added. The gas then moves into the process vessel, where E-beam is applied to it. In the process vessel, SO_x and NO_x are oxidized to become sulfuric acid and nitric acid, respectively, which in turn react with ammonia to produce fine particles of ammonium sulfate and ammonium nitrate, respectively.
