Asthma inhalation formulations are specialized medications designed to deliver drugs directly to the lungs, offering rapid relief and control of asthma symptoms. These formulations typically include bronchodilators, which relax the muscles around the airways, and corticosteroids, which reduce inflammation. Inhalation allows the medication to act quickly and directly on the affected areas with fewer systemic side effects compared to oral or intravenous treatments. Common inhalation devices include metered-dose inhalers (MDIs), dry powder inhalers (DPIs), and nebulizers, each tailored to different patient needs and preferences. Advances in inhalation technology, such as the development of breath-actuated inhalers and combination inhalers containing multiple drugs, have improved the management of asthma by enhancing drug delivery and patient adherence.
