Attack surface management software is used to continuously monitor networks, assets, cloud services, and other items to identify, address, and remediate vulnerabilities. These tools automate many tasks and help prioritize impactful threats and vulnerabilities to minimize risk. These tools also extend the capabilities of code-centric vulnerability management tools to address infrastructure and other Internet-facing assets. Modern applications and computing environments generate a large number of threat vectors that allow attackers to gain system access and/or impact performance. Attack surface management solutions are designed to analyze network and cloud assets in real time to uncover misconfigurations, weak passwords, shadow IT and countless other vectors. Once threats are understood and tracked, companies integrate threat data into other security solutions, automate remediation, and continuously update network defenses as threats arise.
