## Abstracts

According to our (Global Info Research) latest study, the global Automated Oligonucleotide Synthesizer market size was valued at US\$ 257 million in 2024 and is forecast to a readjusted size of USD 458 million by 2031 with a CAGR of 8.7% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Automated oligonucleotide synthesizers are usually based on the principle of solid phase synthesis and use the phosphoramidite method for synthesis. During the synthesis process, appropriate reagents are delivered to individual wells containing growing oligonucleotide chains, which are bound to solid supports. Each well has a filter bottom to facilitate the removal of used reagents while retaining the solid support matrix. The synthesis environment is controlled by a sealed design, and the entire instrument is automated by computer control.
