Abstracts

According to our (Global Info Research) latest study, the global Automatic Pilling Grading System market size was valued at US\$ 61.74 million in 2025 and is forecast to a readjusted size of US\$ 85.88 million by 2032 with a CAGR of 4.9% during review period.

An automatic pilling grading system is a textile quality inspection system based on machine vision, artificial intelligence, and automated control technologies. This system uses a high-resolution camera to simulate standard observation conditions, automatically capturing images of 'pilling' (friction) formed on the fabric surface due to friction. It then employs image processing algorithms and deep learning models to quantitatively analyze the quantity, size, density, contrast, and uniformity of the pilling. Ultimately, based on preset international or industry standards, the system automatically outputs an objective and repeatable pilling grade, replacing traditional manual visual comparison and grading methods. The demand stems from the textile and apparel industry's urgent pursuit of digital, standardized, and efficient quality control. Its upstream supply chain relies heavily on the research and integration of high-resolution industrial cameras and optical lenses, precision motion control modules, AI vision algorithm libraries, and specialized mechanical structures. Downstream, it directly serves textile fabric manufacturers, third-party testing institutions, and high-end apparel manufacturers. In 2025, the average selling price of an automatic pilling grading system was approximately US\$25,000 per unit, with a gross profit margin of approximately 35%.
