Abstracts

According to our (Global Info Research) latest study, the global Bio-based Encapsulation Film market size was valued at US\$ 3015 million in 2025 and is forecast to a readjusted size of US\$ 7323 million by 2032 with a CAGR of 13.7% during review period.

In 2024, global production of bio-based encapsulation films reached 600,000 tons, with an average selling price of approximately US\$4,200-7,100 per ton, a gross profit margin of about 30%, and a single production line capacity of approximately 3,000-6,000 tons per year. Bio-based films are a type of thin film material made from at least some renewable biomass raw materials (rather than traditional fossil fuels) through biological, chemical, and polymeric processes, used for encapsulation, protection, or bonding in specific fields. The upstream consists of biomass raw material suppliers, providing renewable resources such as corn, sugarcane, and starch; the midstream is the film manufacturing stage, which uses chemical synthesis and modification to produce bio-based polymer films such as PLA and PGA; the downstream is widely used in packaging, agricultural mulch films, photovoltaic modules, and other fields. The demand fundamentally stems from increasingly stringent global environmental policies and a growing awareness of sustainability among consumers. It is strongly driven by national 'plastic restriction' regulations and brand owners' ESG goals, with end consumers' preference for green packaging further fueling the demand for this renewable and biodegradable material as an alternative.
