A bioabsorbable sirolimus-eluting coronary stent system is an advanced medical device used to treat narrowed or blocked coronary arteries. This system consists of a stent made from bioabsorbable materials and coated with sirolimus, a drug that helps to inhibit restenosis. Once implanted into the coronary artery, the stent provides mechanical support to keep the vessel open, while the sirolimus coating gradually releases the drug to inhibit endothelial cell proliferation, reducing the risk of restenosis. Over time, the bioabsorbable stent is gradually absorbed by the body, reducing the complications associated with long-term implantation and allowing the vessel to return to its natural function.
