Bioinductive implants are advanced medical devices designed to promote the body's natural healing processes by stimulating tissue regeneration and repair. Unlike traditional implants that primarily provide structural support, bioinductive implants encourage the growth of new, healthy tissue by releasing biological signals that activate cells and trigger the formation of new tissue at the implant site. These implants are often made from bioresorbable materials, meaning they gradually dissolve as the body heals, leaving behind regenerated tissue. Bioinductive implants are commonly used in orthopedic and soft tissue applications, such as tendon repair or cartilage regeneration, offering a less invasive solution to enhance recovery and reduce the risk of long-term complications.
