Abstracts

According to our (Global Info Research) latest study, the global Bismuth-Zinc Catalyst market size was valued at US\$ 136 million in 2025 and is forecast to a readjusted size of US\$ 179 million by 2032 with a CAGR of 4.0% during review period.

Bismuth-Zinc Catalyst is a highly efficient and environmentally friendly bimetallic catalyst composed of zinc and bismuth. In applications such as polyurethane synthesis, bismuth and zinc exhibit a synergistic effect: organic bismuth primarily provides the necessary speed and selectivity for the initial gelation and curing process, while organic zinc focuses on accelerating the cross-linking process in the later stages of the reaction, thereby achieving precise control over the curing process. The core advantage of this catalyst lies in its ability to effectively replace traditional toxic catalysts such as lead, mercury, and tin, meeting increasingly stringent environmental regulations.

From a supply chain perspective, the upstream segment involves the supply of basic chemical raw materials such as zinc and bismuth metals and corresponding organic acids (such as neodecanoic acid and isooctanoic acid). The downstream application market is centered on the polyurethane industry. Global sales are projected to be approximately 11,000 tons in 2025, with an average market price of approximately US\$12 per kilogram. The industry's gross profit margin is in the range of 15%–30%.
