Bite registration material is a dental material used to capture and record the relationship of a patient's upper and lower teeth when they are in a biting position. This recorded bite or 'occlusion' helps dentists and dental technicians create precise dental restorations such as crowns, bridges, dentures, and orthodontic appliances that fit comfortably and properly. The material must accurately capture the patient's bite and not deform to ensure that the final dental restoration is properly aligned. Once set, the material should retain its shape and not expand or contract, ensuring that the recorded bite is not distorted when transferred to the dental laboratory. The material should be safe, non-toxic, and comfortable during the short time it is in the patient's mouth.
