## Abstracts

According to our (Global Info Research) latest study, the global Carbide Roller Ring market size was valued at US\$ 615 million in 2025 and is forecast to a readjusted size of US\$ 885 million by 2032 with a CAGR of 5.3% during review period.

Carbide roller rings are made from carbide, a composite material that combines tungsten carbide particles with a metal binder, usually cobalt. This unique composition gives carbide roller rings exceptional hardness and wear resistance, making them ideal for high-stress applications in the steel industry. Unlike traditional steel rings, carbide roller rings can withstand extreme conditions, including the high temperatures and abrasive environments common in steel production. Carbide roller rings have become an important part of the steel industry, known for their durability, wear resistance and ability to increase production efficiency. Demand for high-performance materials such as carbide roller rings continues to grow as manufacturers strive to increase productivity and reduce operating costs. In 2025, global Carbide Roller Ring production reached approximately 11.36 K MT, with an average global market price of around US\$ 52.69 per kg.

The annual production capacity of carbide roller rings is 16,000 tons, with a gross profit margin of about 20%.

The upstream core is tungsten resources and powder systems, including binder phase powders such as tungsten carbide powder, cobalt powder or nickel powder, additives such as carbon black and grain inhibitors, and forming aids such as paraffin. It also includes key manufacturing-end consumables such as graphite molds, sintering and hot isostatic pressing consumables, diamond grinding wheels and EDM consumables. The

midstream is a cemented carbide powder metallurgy and precision processing enterprise. Typical processes include batching and ball milling, granulation and press forming, vacuum sintering, hot isostatic pressing densification, rough and fine grinding and hole processing, dynamic balancing and non-destructive testing. The downstream is mainly in the field of steel and non-ferrous metal rolling, including high-speed bar and wire rolling mills, section steel and narrow strip rolling mills, copper and aluminum processing and rolling mills, as well as roll and rolling mill spare parts service providers and equipment integrators supporting steel mills.

Material costs usually account for about 55% to 72% of the total cost, of which tungsten carbide powder and binder phase powder account for about 45% to 65% in total, additives and auxiliaries account for about 1% to 3%, amortization of molds and consumables accounts for about 3% to 6%; manufacturing expenses usually account for 18% to 30%, and other costs account for 6% to 12%.
