## Abstracts

According to our (Global Info Research) latest study, the global Carina Endobronchial Blocker market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The carina-type endobronchial blocker is an advanced medical device, mainly used in thoracic surgery and surgery requiring single-lung ventilation. Its core feature is its unique carina-type design, which can be accurately placed in the carina of the bronchus, and block the ventilation of the target lobe by inflation, while maintaining normal ventilation of the other lobe. This design allows more precise control of lung ventilation during surgery, improving the safety and success rate of surgery. The carina-type endobronchial blocker is usually composed of multiple components such as a catheter, a balloon, an inflation connector, and a conversion connector. Among them, the catheter is used to guide the blocker into the bronchus, and the balloon is inflated to block the airway. The inflation connector is used to connect the inflation device, and the conversion connector is used to connect the ventilator or other medical equipment to achieve airway switching and ventilation control.

With the continuous advancement of medical technology and the increase in clinical application demand, the carina-type endobronchial blocker market has shown a steady growth trend. Especially in minimally invasive surgery such as video-assisted thoracoscopic surgery (VATS) and robot-assisted thoracoscopic surgery (RATS), the

use rate of carina-type endobronchial blockers has increased significantly, driving the growth of market demand. Carina-type endobronchial blockers are mainly used for thoracic surgery, lung isolation during single-lung ventilation, or treatment that requires differential lung ventilation. It completely or partially closes the airway through inflation to achieve precise lung isolation and ventilation control. Carina-type endobronchial blockers play an important role in lung cancer surgery, lung disease treatment, and lung function testing. In summary, the carina-type endobronchial blocker market has broad development prospects and huge market potential. With the continuous advancement of medical technology and the increase in clinical application demand, the market will continue to maintain a steady growth trend.
