According to our latest research, the global Cell-Free Protein Synthesis (CFPS) market size will reach USD 357 million in 2031, growing at a CAGR of 6.1% over the analysis period.

Cell-free protein synthesis (CFPS) is an in vitro technique that allows for the production of proteins outside of living cells. This method utilizes the cellular machinery, such as ribosomes, tRNAs, and enzymes, extracted from cells, typically bacteria like E. coli, to synthesize proteins. CFPS offers several advantages over traditional in vivo protein synthesis, including faster production times, the ability to synthesize proteins that may be toxic to living cells, and greater control over the synthesis environment. This technology is highly versatile and is used for various applications, such as producing proteins for research, pharmaceuticals, and industrial enzymes. Additionally, CFPS systems can be tailored to incorporate non-standard amino acids, enabling the production of proteins with novel properties?
