Cell and Gene Therapy (CGT) drugs are a class of innovative treatments that treat diseases by changing the patient's cells or genes. Specifically, CGT drugs usually include: 1. Gene therapy: by introducing, deleting or repairing genes into the patient's cells, the purpose is to correct diseases caused by genetic defects or mutations. For example, gene therapy can deliver normal genes to patients through viral vectors to replace missing or defective genes.

2. Cell therapy: by changing or enhancing the patient's own cells and then re-injecting them into the body for treatment. Common cell therapies include using immune cells (such as CAR-T cells) to treat cancer or using stem cells to repair damaged tissues.
