Abstracts

According to our (Global Info Research) latest study, the global Centrifugal Defoaming Machines market size was valued at US\$ 238 million in 2023 and is forecast to a readjusted size of USD 354 million by 2030 with a CAGR of 6.2% during review period.

Centrifugal Defoaming Machines are devices that use centrifugal force to remove foam and bubbles from liquids. They are widely used in various production processes, especially in areas where foam removal is required to ensure product quality and stability. By rotating at high speed, these machines can effectively separate bubbles or foam from liquids, making the liquid purer or more uniform.

With the acceleration of global industrialization and the continuous advancement of technology, the market for Centrifugal Defoaming Machines has shown a steady growth trend. Centrifugal defoaming technology, as an efficient defoaming method, is widely used in many industries such as food, beverage, chemical, pharmaceutical, coating, and electronic manufacturing. These industries have increasingly higher requirements for product quality and stability of the production process, which has promoted the growth of demand for high-performance defoaming equipment.

At present, the global Centrifugal Defoaming Machines market presents a relatively mature development situation. Especially in developed countries, the application of automation and efficient equipment has become the norm in industrial production, while in emerging markets, with the acceleration of industrialization, market demand is also gradually increasing. Especially in Asia, China, India and Southeast Asian countries, with the rapid development of manufacturing and chemical industries, have become an important driving force for market growth.

Although the market demand for centrifugal defoamers has increased year by year, its popularity and breadth of application are still restricted by factors such as equipment

cost, energy consumption, technical barriers, and market dependence on alternative technologies (such as chemical defoamers and physical defoaming). High-performance centrifugal degassing machines are usually expensive, and the initial investment and subsequent maintenance costs of the equipment are high. Especially for small and medium-sized enterprises, the investment in equipment has become one of the bottlenecks in market expansion.
