According to our (Global Info Research) latest study, the global CFSE Cell Proliferation Kit market size was valued at US\$ 304 million in 2024 and is forecast to a readjusted size of USD 391 million by 2031 with a CAGR of 3.7% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Amine-reactive dye CFSE (carboxyfluorescein diacetate, succinimidyl ester, also known as CFDA-SE) is widely used in cell proliferation and in vivo cell tracking. CFSE is non-fluorescent until it enters viable cells, where it is hydrolyzed by cytoplasmic esterase enzymes to release fluorescent amine-reactive dyes. These dyes then covalently react with the amine groups on intracellular proteins to form fluorescent conjugates that are retained in the cells. Moreover, due to this stable linkage, once the dyes are incorporated into the cells, they do not transfer to adjacent cells. CFSE was originally developed to track lymphocyte migration. Subsequent studies revealed that this dye can be used to monitor cell proliferation both in vitro and in vivo, as CFSE fluorescence in progeny cells was gradually halved as the cells division.
