## Abstracts

As we know, 97% of the world's water is undrinkable salt water and more than half of the 3% that is freshwater, is inaccessible due to polar ice caps. Even though 70% of the earth is covered by water, more than 50% of the world population has insufficient drinking water. According to the World Bank, \$600 billion is invested in water delivery systems and the United Nations has announced a worldwide water shortage. Scientists have given warning of this and constructive steps are being taken, but current methods to achieve clean drinking water are expensive and wasteful.
