In the transmission system, noise is classified in two ways: one is differential mode noise and the other is common mode noise. Chip ferrite blocks are used to clean differential mode noise generated from either the signal line or power line circuit. Chip ferrite blocks are used to absorb high-frequency noise and transform it into heat, to filter out the unwanted signal (noise).

Chip ferrite block is one of the most efficient and simple filter types and is widely used in many areas of electronic equipment, which is the major driving factor for the market growth. Chip ferrite blocks are increasingly used in electronic equipment to reduce electromagnetic interference, and due to their many advantages, there is an increasing demand for chip ferrite blocks, military and aerospace systems and subsystems, electrical appliances, factories. Surging adoption of chip ferrite blocks in applications such as automation equipment and many other devices along with increasing use of chip ferrite blocks in the transportation and automotive industries is expected to improve market growth over the forecast period.
