According to our (Global Info Research) latest study, the global Clark Electrode market size was valued at US\$ 15 million in 2024 and is forecast to a readjusted size of USD 21.3 million by 2031 with a CAGR of 5.2% during review period.

Clark Electrode is a silver-platinum electrochemical cell whose electrodes are covered by non-conductive membranes. They are used to measure gaseous or solubilized oxygen in the liquid. Clark Electrodes rely on the limited permeability to oxygen of non-conductive membranes, which reduces oxygen loss at the electrodes and allows the quantification in circulating blood. The Clark Electrodes are one of the inventions that become the basis of modern blood gas analyzers, which quantify the blood pH, oxygen, and carbon dioxide level in vitro and in vivo. The same principle used for Clark oxygen electrodes has been adapted to build other gas measuring devices and biochemical sensors for medical, agricultural, and other industrial applications.
