According to our (Global Info Research) latest study, the global CMP Slurry Filters market size was valued at US\$ 66.8 million in 2024 and is forecast to a readjusted size of USD 92.3 million by 2031 with a CAGR of 4.8% during review period.

Chemical mechanical planarization (CMP) is a polishing process used to manufacture wafers for the semiconductor industry. It requires the use of a polishing tool and polishing slurry. The slurry in the tool is delivered to the wafer surface and may contain large particles/agglomerates ($> 1 \mu$) as a result of shipping/handling issues, drying, and interactions within the slurry distribution systems. These large particles can, in turn, increase the level of defectives (scratches) on the semiconductor wafer surface found after the CMP process has been completed. One of the solutions for decreasing the level of defects caused by large slurry particles is through the use of slurry filtration. For these applications, 0.5 to 5 micron filters are typically used.

The industry market is very concentrated. Of the manufactures, Entegris, Pall and Cobetter captured the top three market share spots in the CMP Slurry Filters market in 2019. Among them, Entegris and Pall combined occupied 87.10% global revenue market share in 2019.
