Abstracts

According to our (Global Info Research) latest study, the global Coating Machine for Fuel Cell Experiments market size was valued at US\$ 138 million in 2025 and is forecast to a readjusted size of US\$ 247 million by 2032 with a CAGR of 8.7% during review period.

In 2025, global Coating Machine for Fuel Cell Experiments production reached approximately 11k units, with an average global market price of around US\$ 12k per unit.

A coating machine for fuel cell experiments is lab/pilot equipment used to apply controlled functional layers (e.g., catalyst layers, MPL, ionomer coatings) onto substrates such as membranes, GDLs, or current collectors—often to develop and prepare CCM/MEA-related samples. It typically supports doctor blade, Mayer/comma bar, slot-die, and (ultrasonic) spray coating, combined with heated/multi-zone drying, web tension control, and coating weight/thickness control to deliver uniform, repeatable, scalable coatings from sheet to small roll-to-roll.

Upstream covers key modules and materials (slot-die heads/metering pumps, coating/doctor components, heated multi-zone dryers, tension/servo control, solvent-resistant seals/tubing, sensors and software) plus lab consumables (membranes, catalyst inks, solvents). Midstream are equipment OEMs and integrators offering sheet coaters, lab R2R coaters, and pilot lines with commissioning and process recipes. Downstream users include fuel-cell R&D labs, universities, materials developers, and CCM/MEA manufacturers for sample development, process validation, and scale-up. Representative suppliers include FOM Technologies and lab/pilot coater platforms like

MTI-type systems.

The annual production capacity of a single-line Coating Machine for Fuel Cell Experiments is approximately 300 unit, with a gross profit margin of approximately 30%-50%.
