According to our (Global Info Research) latest study, the global Conductive Particles (Conductive Fine Particles) market size was valued at US\$ 107 million in 2023 and is forecast to a readjusted size of USD 143 million by 2030 with a CAGR of 4.5% during review period.

Conductive Fine Particles are micro-sized particles made of high-purity metals, typically ranging from 1 to 20 micrometers in diameter, with excellent conductivity and corrosion resistance. They are widely used in applications such as liquid crystal displays (LCDs), OLEDs, RFID antenna assembly, and flexible electronic devices, enabling efficient electrical connections that meet the demands for high resolution and narrow pitch. As the demand for high-performance electronic components increases, the market for conductive fine particles is rapidly growing, driving the development of smaller and more intelligent electronic devices.

The industry is moving towards the development of materials with higher conductivity, lower resistance and more environmentally friendly. For example, gold (Au) and silver (Ag) are plated on the surface of conductive fine particles to improve their conductivity and corrosion resistance. The ultra-thin and flexible electronic devices are an irreversible trend. The application of conductive fine particles in flexible displays and flexible circuit boards will continue to grow, promoting the further optimization of particle materials. By introducing automation and advanced manufacturing processes (such as nanotechnology, wet reduction, etc.), the consistency and efficiency of conductive fine particle production can be improved while reducing costs.
