A ventilator is a medical device that can effectively replace, control or change a person's normal physiological breathing, increase lung ventilation, improve respiratory function, reduce respiratory consumption, and save heart reserve. It can provide breathing and mechanical ventilation for patients who are physiologically unable to breathe or have insufficient breathing. Modern ventilators are computer controlled, but patients can also be breathed using a simple manual bag-valve resuscitation ball. Ventilators are primarily used in critical care medicine, home care, and emergency medicine (as well as anesthesiology).
