The constant temperature and humidity cell culture incubator is a professional device that integrates precise temperature and humidity control functions. It provides a stable and suitable growth environment for cell culture by precisely controlling temperature and humidity. The incubator monitors the temperature in real time through the temperature sensor built into the incubator, and transmits the data to the temperature controller (micro information processor) for processing. According to the difference between the set value and the measured value, the temperature controller adjusts the air heating unit or the refrigeration solenoid valve to achieve precise temperature control. Similarly, the humidity sensor built into the incubator monitors the humidity in real time and transmits the data to the humidity controller for processing. By adjusting the heating amount of the water tank heating element or the opening of the refrigeration solenoid valve, precise control of humidity can be achieved.
