Abstracts

According to our (Global Info Research) latest study, the global Continuous-Flow Reactor market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Continuous-flow reactors are also called as flow reactors, where feeding of the substrate is carried out continuously and the product is collected from the outlet of the reactor. These reactor vessels are used in flow chemistry applications. Flow Chemistry is a synthetic technique which is complementary to traditional batch methods. It is the process of performing chemical reactions in a continuous tube or capillary. In the flow chemistry process, the reagents are pumped together at a mixing junction and the flow continues down a the tube which can also be heated or cooled or irradiated with photons (photochemistry) or have a potential applied across it (electrochemistry). Compared with traditional batch methods, the same chemistry is performed but the desired product is continuously eluted from the continuous flow reactor. Apart from offering excellent capabilities to control various reaction conditions and parameters, Continuous-flow reactors also provide advanced heat transfer, improved mixing, easier scalability when compared to batch production, better management of hazardous reagents and lower energy consumption and cost.
