Corneal Shape Analyzers are diagnostic devices used to map the curvature and shape of the cornea, the transparent outermost layer of the eye. These devices are essential tools in ophthalmology and optometry for diagnosing corneal irregularities, refractive errors, and conditions such as keratoconus. While corneal topographers are primarily used for mapping the curvature and shape of the cornea, they can also play a role in the diagnosis and management of dry eye disease. Corneal topography can provide valuable information about the ocular surface, tear film dynamics, and corneal epithelial irregularities associated with dry eye.
