The coronary double-guidewire balloon dilatation catheter is a medical device specially designed for the treatment of coronary artery stenosis. The coronary double-guidewire balloon dilatation catheter is usually composed of multiple parts such as the catheter seat, catheter reinforcement, tube body, balloon, inherent guidewire and tip. Among them, the balloon is the expanded part at the end of the catheter, which is inflated to dilate the blood vessel; the inherent guidewire is fixed on the outside of the balloon and is used to guide the catheter into the coronary artery. In addition, the outer surface of the catheter may be coated with a hydrophilic coating to improve its lubricity and pushability. The balloon material is usually made of high-strength and high-elasticity polymer materials such as nylon to ensure that it can withstand sufficient pressure and maintain a stable shape after inflation. The inherent guidewire and traction wire are made of metal materials such as stainless steel to provide sufficient strength and rigidity to support the pushing and positioning of the catheter.
