According to our (Global Info Research) latest study, the global Coronary FFR Monitoring System market size was valued at US\$ 2457 million in 2024 and is forecast to a readjusted size of USD 7120 million by 2031 with a CAGR of 16.6% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Fractional flow reserve (FFR) is defined as the ratio of the maximum blood flow provided to the myocardium by the coronary artery in the presence of stenosis to the maximum blood flow that the myocardium can obtain in the absence of stenosis. When the small blood vessels in the coronary artery supply area are maximally dilated and the central venous pressure is not significantly increased, FFR is approximately equal to the pressure at the distal end of the coronary artery stenosis ( $P_d$ ) divided by the aortic pressure ( $P_a$ ), that is,  $FFR = \text{mean pressure in the coronary artery distal to the stenosis } P_d / \text{mean pressure in the aorta at the coronary artery orifice } P_a$  (when the blood vessels are maximally dilated).
