The Coronary Artery Rapamycin Targeted Eluting Stent System is an advanced medical device used to treat coronary artery disease, combining coronary stents and drug eluting technology. The stents of this system are usually made of metal and designed into a mesh structure that can support the blood vessel wall and keep the artery open. The surface of the stent is coated with a polymer coating containing rapamycin, which has an anti-proliferative effect and can inhibit the proliferation and migration of vascular smooth muscle cells to prevent the occurrence of restenosis in the stent. After the stent is implanted in the blood vessel, rapamycin will be slowly released from the coating and enter the surrounding tissues, where it will continue to exert its efficacy and reduce the risk of restenosis.
