## Abstracts

According to our (Global Info Research) latest study, the global Cryoballoon Catheter market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

A cryoballoon catheter is a catheter specifically used for cryoablation surgery. Its characteristic is that an expandable balloon is installed at the end of the catheter. This balloon can quickly reduce the temperature when it contacts the target tissue by filling it with a cryomedia (such as liquid or gaseous refrigerant), thereby achieving the purpose of ablating the diseased tissue.

The working principle of the cryoballoon catheter is based on cryoablation technology. During the operation, the doctor inserts the catheter into the patient's body and accurately locates the lesion area through the navigation system. Then, the balloon is expanded and filled with cryomedia by the handle. The low temperature of the cryomedia can quickly cool and freeze the target tissue to achieve the effect of ablation. This cryoablation technology can be used to treat a variety of diseases, such as tumors, arrhythmias, etc.

Cryoballoon catheters have a wide range of applications in the medical field, especially in cardiovascular interventional surgery. For example, in atrial fibrillation ablation surgery, the cryoballoon catheter can accurately locate the pulmonary vein ostium and

isolate the pulmonary vein potential through cryoablation technology, thereby effectively treating atrial fibrillation. In addition, cryoballoon catheters can also be used to treat other types of arrhythmias, tumors, and some orthopedic diseases.
