According to our (Global Info Research) latest study, the global Crystal Lenses market size was valued at US\$ 103 million in 2024 and is forecast to a readjusted size of USD 112 million by 2031 with a CAGR of 1.3% during review period.

Natural crystal was originally used as raw material for making lenses. Later, with the development of the glass industry, glass materials gradually replaced natural crystals. Due to the development of technology and some characteristics of crystals, crystal lenses have received more attention. Crystal lenses have certain benefits to the eyes. To a certain extent, they can prevent eye trauma, resist ultraviolet rays, block heat, and resist acidic environments.

History of crystal glasses: As an optical material, the biggest advantage of crystal is its high hardness, and the lenses made are not easy to wear. It was popular in the 1920s and 1930s. Because the lenses it makes are durable and expensive, they are often passed on to the next generation. The lens industry has mainly experienced three development stages: crystal lens, glass lens and resin lens. Resin material is currently the most commonly used lens material. From the perspective of the development history of the entire lens industry, the development history of the lens industry is a process of constantly seeking 'lighter, thinner, clearer, and safer'.
