According to our latest research, the global CT-FFR Analysis Software market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Coronary heart disease is a major cardiovascular disease that threatens human life and health, and its prevalence is still on the rise. Coronary artery angiography (CCTA), as one of the current mature and effective imaging examination technologies, can provide clinical anatomical stenosis information, but it is difficult to evaluate the impact of stenosis on myocardial blood supply from a functional perspective.

The fractional flow reserve (FFR) obtained by coronary CT angiography is a new technology in the field of vascular imaging in recent years and has become the gold standard for functional evaluation of coronary ischemia. However, as an invasive examination procedure, FFR often needs to be performed in the catheterization room, with high medical costs and long operation time, and its application in clinical scenarios is somewhat limited.

Different from FFR, CT-FFR provides a non-invasive examination option. Combining coronary CTA anatomy and FFR functional evaluation, CT-FFR does not require the additional use of adenosine and other drugs, nor does it require the use of FFR pressure guidewires for invasive interventional operations. Based on artificial intelligence technology, the CT-FFR value at any location on the coronary artery tree can be calculated, providing a non-invasive, one-stop anatomical and functional evaluation, and facilitating the precise diagnosis and treatment of coronary heart disease.
