## Abstracts

According to our (Global Info Research) latest study, the global Density Separation Equipment market size was valued at US\$ 1698 million in 2025 and is forecast to a readjusted size of US\$ 2440 million by 2032 with a CAGR of 5.4% during review period.

Density separation equipment is a type of technical equipment that uses the density difference between materials as the main basis for sorting, separating mixtures into different components or removing impurities through specific physical processes. It creates a specific medium or force field (such as water, airflow, heavy liquid, or centrifugal force field) to cause materials of different densities to exhibit differentiated motion states (such as settling velocity, suspension position, and trajectory), thereby achieving physical separation by density stratification. The demand for density sorting equipment mainly stems from the rigid need for low-cost, high-efficiency physical separation technologies in the mining, resource recycling, and environmental protection industries. Its core purpose is to enrich valuable minerals from ores, recover high-value materials such as metals/plastics from industrial or municipal waste, or purify agricultural and industrial raw materials. Upstream and downstream supply chains: The upstream mainly includes suppliers of special steel, wear-resistant/corrosion-resistant materials (such as polyurethane and ceramics), motors and transmission components, pumps and valves, and automated control systems; the downstream directly serves mine operators, solid waste treatment companies, and end users in industries such as metallurgy, chemicals, and food processing. The concentrates or sorted materials produced will further enter smelting, recycling, or production processes, forming a key link in resource recycling and industrial manufacturing. In 2025, the output of density separation equipment is estimated at approximately 55,000 units, with an average selling price of approximately US\$30,000 per unit, a gross profit margin of

approximately 35%, and a single-line capacity of approximately 1,000 units per year.
