prepare tooth surfaces for bonding procedures, such as placing dental restorations or orthodontic brackets. These acids, typically phosphoric acid solutions, create micro-etching patterns on enamel and dentin, enhancing the surface area for better adhesion. By selectively demineralizing the outer layer of the tooth, etching acids improve the effectiveness of dental adhesives and cements. Proper application of etching acids is essential for ensuring strong, long-lasting bonds in various dental treatments, ultimately contributing to the success of restorative and cosmetic procedures.
