Depolarizing muscle relaxants are a class of drugs used to induce muscle paralysis, primarily during surgical procedures or critical care situations, such as endotracheal intubation or mechanical ventilation. These agents work by mimicking acetylcholine, a neurotransmitter, at the neuromuscular junction, which results in initial muscle contraction, followed by a prolonged state of muscle relaxation or paralysis. This unique mechanism distinguishes depolarizing muscle relaxants from non-depolarizing muscle relaxants, which work by blocking acetylcholine receptors.
