Diving Decompression Cabin is an important equipment to assist divers in saturation diving, and it is also an important means of treating decompression sickness. When divers come ashore from deep waters, they may suffer from decompression sickness, a disease caused by changes in pressure, due to the rapid decrease in pressure in the surrounding environment. The function of a diving decompression chamber is to provide divers with a high-pressure working and living environment, allowing them to gradually eliminate the dissolved inert gases in their bodies after exiting the water, thereby preventing the occurrence of decompression sickness.
