Double flap valve, also known as double heavy hammer flap valve or air lock, is a commonly used industrial valve, mainly used for quantitative discharge and air lock of powdery and granular materials, and widely used in the discharge systems of various dust collectors, grinders, dryers, silos and other equipment. Double flap valve is mainly composed of two flap valves, each of which can be opened and closed independently. When the material falls through the upper flap valve, the upper flap valve is closed, and the lower flap valve is opened at the same time, and the material continues to fall. This alternating switch design can effectively prevent air from entering and material leakage, and maintain the airtightness of the system.
